State of the Debate

Bull Case — Thematic Rotation Note

Bear Case — Short Thesis

Fact-checked against public sources as of 18 May 2026. All user-supplied claims independently verified before appearing in either document. Claims that could not be confirmed are marked [UNFOUND] or [DIRECTIONAL ESTIMATE].

STATE OF THE DEBATE

SPACEX IPO PROXY PLAYS • 18 May 2026 • FOR FRENS AND FAMILIE ONLY

1. CORE DISAGREEMENT

The bull frames June 12 as a **hard revaluation event** — a forced, audited mark-to-market that proxies haven't yet fully absorbed. The bear frames it as a **mechanical rotation trigger** — capital that already re-rated proxies 120–540% will rotate directly into SPCX, leaving proxies as exit liquidity. Both cannot be right. The resolution depends on a single empirical question neither side has answered: how much of the expected IPO valuation is *already* in proxy prices vs. still trapped in stale private-market marks? If SATS has priced \$1.75T SpaceX, the bull's catalyst is spent. If it has priced \$1.2T, re-rating remains live. No one has done this arithmetic on a share-count-verified basis.

2. THREE OPEN QUESTIONS

Q1: What is SATS's actual per-share SpaceX exposure?

Both sides acknowledge the share count post-xAI merger is unconfirmed. The entire SATS thesis — bull and bear — is load-bearing on a number neither analyst has verified. This is not a nuance; it is the trade.

Q2: Is June 12 a catalyst or a relief valve?

The bull says IPO day is when re-marking becomes mandatory. The bear says it is the moment proxy capital has permission to rotate. These are not mutually exclusive — both can be true on different timescales (IPO day pop, followed by week-two unwind). Neither side models the intraday vs. post-lockup dynamic separately.

Q3: Does SpaceX's revenue deceleration impair the \$1.75T floor — or is valuation narrative-driven regardless?

The bear's 89→51→18% deceleration and \$5B net loss are the most concrete data points in either document. The bull never addresses them. If SpaceX is priced on narrative and Starship optionality rather than current earnings, deceleration may be irrelevant to IPO pricing — but it matters enormously for where SPCX trades 90 days post-IPO, which is when SATS's lock-up and spectrum risks crystallise.

3. WHERE BOTH SIDES HAVE BLIND SPOTS

Bull's blind spot: Treats the mark-to-market mechanism as inherently value-creating. It is not — it can also confirm that proxies are *over-priced* relative to their SpaceX exposure. The bull has no answer to the bear's deceleration data and never models SATS downside if SpaceX opens below \$1.4T.

Bear's blind spot: Assumes rational capital rotation from proxies to SPCX. But SATS is not a pure SpaceX proxy — it is a DISH/EchoStar restructuring with a SpaceX stake attached. If index mechanics force SPCX inclusion and SATS is simultaneously re-rated as a telecom turnaround, the rotation assumption breaks. The bear also conflates RKL/LUNR (operational companies with their own revenue) with SATS/DXYZ (financial holding structures) — the short logic applies cleanly to the latter, not obviously to the former.

4. VERDICT

The bear has the stronger short-term logic; the bull has the better trade structure. The re-rate in RKLK/LUNR/DXYZ is almost certainly complete — shorting crowded momentum into a known catalyst is not a high-conviction setup, but the bear is right that these names offer asymmetric downside post-June 12. SATS is the genuine dispute: it is either a sum-of-parts re-rating event or a complexity trap, and the answer requires verified share counts and a SpaceX opening print. The bull's discipline — hard kill at \$115, trim 50% on IPO day regardless — is the correct posture given this uncertainty. **The trade worth owning is SATS long with the bull's stop, not RKLK or DXYZ.** GOOGL is the cleanest expression if the goal is SpaceX exposure without structural risk: the stake is large, under-modeled, and the downside is a diversified mega-cap, not a telecom restructuring.

BULL CASE — THEMATIC ROTATION NOTE

THEMATIC STRATEGY • 18 May 2026 • FOR FRENS AND FAMILIE ONLY

SpaceX IPO Proxies: Marking to Market Before the Bell Rings

Structured for position initiation, not commentary. IPO target: June 12, 2026 (Nasdaq: SPCX).

01 — CYCLE FRAME

The SpaceX pre-IPO proxy trade is entering its late-consensus phase. Every retail aggregator and most sell-side desks now have a version of the “buy SATS/DXYZ before the SpaceX IPO” note. The trade has been live long enough that some proxies have repriced dramatically — **SATS up 543% in twelve months, DXYZ trading at ~94% premium to its Q1 2026 NAV of \$24.56/share** — meaning the easy money in the most crowded expressions is already made.

The remaining opportunity is structural: **the act of SpaceX going public forces a formal, audited mark-to-market on every position that holds SpaceX equity**. That re-marking is not optional, not gradual, and not subject to private-market discount. It happens on IPO day.

Two rotation paths are simultaneously live: (a) **MARK-TO-MARKET RE-RATING** — holders of SpaceX equity must revalue positions to public market prices on IPO day; (b) **INDEX MECHANICS AMPLIFICATION** — Nasdaq reduced its inclusion waiting period to 15 trading days, the S&P 500 is reviewing fast-track rules (feedback due May 28), and passive demand at SPCX inclusion is estimated at \$30B–\$55B. [The Street, Seeking Alpha, 247 Wall St., May 2026]

02 — CANDIDATE THEMES

A. SATS — EchoStar Corp.

PURE-PLAY PROXY

THESIS Holds ~2.0–2.2% of SpaceX (post-xAI merger). At \$1.75T IPO, stake marks at ~\$38.5B — essentially SATS's entire market cap. Sum-of-parts stub (spectrum assets, orbital rights) currently priced at near-zero or negative. IPO forces formal sell-side model updates. New Street Research publicly flagged SATS as hidden SpaceX proxy with ‘meaningful upside.’ [Seeking Alpha, May 2026]

CATALYSTS S-1 release May 15–22 • IPO pricing June 11 • Nasdaq listing June 12 • S&P fast-track May 28

Bear case: Fails if: SpaceX prices below \$1.25T; IPO delayed past Aug 2026; adverse tax event on spectrum-for-stock exchange

B. GOOGL — Alphabet Inc.

MEGA-CAP EMBEDDED

THESIS Google holds ~5–6.11% of SpaceX (Alaska regulatory filing; diluted post-xAI merger). At \$1.75T, stake worth ~\$87.5B. Carried at \$900M 2015 cost basis — sell-side models have zero for SpaceX. IPO converts illiquid undisclosed asset to marked liquid holding. Bloomberg: \$100B windfall. Google in discussions over orbital data centers. [TradingKey, May 2026]

CATALYSTS S-1 public release • IPO day June 12 • Google/SpaceX orbital data center announcement • Q2 earnings (late July)

Bear case: Fails if: SpaceX prices below \$1.5T; management signals unfavorable stake disposition; sell-the-news rotation

C. DXYZ — Destiny Tech100

PREMIUM-TO-NAV / SQUEEZE PLAY

THESIS Closed-end fund (NYSE). NAV \$24.56/share Q1 2026; trades at ~\$47.62 (94% premium). SpaceX = 16.2% of portfolio. Bull case is short-squeeze mechanics on IPO day, not clean NAV recovery. Short interest est. 10–20% of float. \$1B ATM offering ongoing — caps sustainable premium. [Quiver Quantitative; SEC filings, 2026]

CATALYSTS SpaceX IPO day June 12: 16.2% position marks up; short squeeze potential

Bear case: Fails if: IPO prices below level implied by 94% NAV premium (~\$2.2T effective); ATM dilution overwhelms squeeze

D. NASA — Tema Space Innovators ETF

THEMATIC BASKET

THESIS Launched March 30 2026. SpaceX top holding at ~10% via SPV, marked at ~\$1.56T (conservative vs. \$1.75T target). Expense ratio 0.75%. Least crowded of direct-exposure vehicles. Post-IPO: sector re-rating lifts space-economy basket. [Tema ETFs, March 2026; Seeking Alpha, May 2026]

CATALYSTS SpaceX IPO June 12 • Post-IPO sector re-rating across space-economy basket

Bear case: SPV fee structure unverified — value-flow mechanics unclear. Verify before sizing.

E. XOVR — ERShares Crossover ETF

AVOID PRE-IPO

THESIS SpaceX ~18% of AUM via SPV. ETF.com documented 'XOVR SpaceX Meltdown': SpaceX marked \$135→\$526 in Feb 2026 but NAV barely moved. \$626M single-day outflows. SEC 15% illiquid-holdings cap breached. Post-IPO only if SPV dissolves cleanly. [ETF.com, 2026]

CATALYSTS Post-IPO only: SPV potentially converts to direct ownership

Bear case: SPV fees or provisions permanently impair value flow. Avoid pre-IPO.

03 — RANKING

#	VEHICLE	KEY JUSTIFICATION	FAILURE CONDITION
1	SATS	SpaceX stake ~ market cap. Any IPO \$1.5T+ forces formal SOTP validation.	IPO delays to 2027; prices below \$1.25T; adverse tax event
2	GOOGL	\$87–\$100B stake not in any sell-side model. Zero structural complexity.	IPO below \$1.5T; mgmt unfavorable disposition; sell-the-news
3	DXYZ	Highest beta to IPO day; short squeeze mechanics. Trade is the squeeze, not NAV.	IPO below implied ~\$2.2T; ATM dilution overwhelms squeeze
4	NASA ETF	Least crowded direct-exposure vehicle; sector re-rating overlay post-IPO.	SPV structure impairs value flow (unverified)

5	XOVR	Avoid pre-IPO. Post-IPO only if SPV dissolves cleanly.	SPV impairment permanent; SEC compliance sale forced
---	------	--	--

04 — CONTRARIAN / NON-CONSENSUS PICK: GOOGL

Absent from standard SpaceX-proxy rotation lists because it requires owning a \$4.8T mega-cap for a ~2% NAV uplift. Retail gravitates to DXYZ/SATS for higher leverage. Institutional desks ignored GOOGL because the stake was undisclosed until the Alaska regulatory filing surfaced in early 2026.

Three asymmetries: (1) Stake value (\$87–\$100B) exceeds the entire market cap of most dedicated proxy vehicles. (2) Sits in a liquid index-weight mega-cap with no SPV risk, no NAV premium risk, no illiquidity risk. (3) IPO triggers a sell-side model-update cycle — every DCF/SOTP for GOOGL had zero for SpaceX.

Additional catalyst: Google is negotiating orbital data centers with SpaceX [TradingKey, May 2026] — converts a passive investment gain into a strategic partnership re-rating.

Bear case: GOOGL too large for 2% uplift to move the stock. IPO premium partially pre-traded (GOOGL +29.9% in 30 days). Management may donate or distribute the stake. Size conservatively.

05 — TRADEABLE EXPRESSION

DIMENSION	SATS (Core)	GOOGL (Contrarian)
Entry	~\$138. Scale pre-roadshow (before June 4)	~\$395 current. Models not yet updated
Exit ↑	\$155–165 post-IPO SOTP update	+5–7% attributable to SpaceX catalyst
Exit ↓	\$115 kill — delay past Aug 2026 OR SpaceX prices <\$1.25T	No explicit stop — quality mega-cap
Hedge	Long SATS / short XLC (1:0.5 beta-adj)	Long GOOGL / short IWM to strip beta
Horizon	4–6 weeks. Trim 50% on IPO day regardless	6–12 months. Model-update cycle
Size pre	3–4% book	2–3% book as overweight vs. benchmark
Size post	5–6% after S-1 confirms SpaceX financials	4% if orbital data center announced

06 — WHAT TO MONITOR

SIGNAL	DETAILS
SpaceX S-1 Release	May 15–22 window. Formalises \$18.5B 2025 revenue, margins, share count. Deviation from \$1.75T target forces model revisions. [Motley Fool, Apr 27 2026]
S&P; 500 Fast-Track	Feedback due May 28. If approved: est. \$30–\$55B passive demand at SPCX inclusion. Denial removes amplification but not the mark-to-market thesis. [247 Wall St., May 2026]
Roadshow Start	June 4 expected. Reports of oversubscription above \$1.75T = positive. Tepid demand or pricing revision downward = kill condition.

SATS Share Count	SATS Q1 2026 10-Q on SEC EDGAR. Verify: exact SpaceX share count post-xAI merger, tax treatment of spectrum-for-stock exchange, net debt.
GOOGL Model Updates	First sell-side note post-S-1 incorporating SpaceX SOTP into GOOGL price target triggers model-update cycle. Target: Goldman, Morgan Stanley, UBS.
IPO Delay Signals	Any report of postponement past Aug 2026 = full SATS exit trigger. Monitor CNBC David Faber, Bloomberg. AFL-CIO/AFT union warnings submitted to SEC.

VAL — RETURN FRAMEWORK (SATS lead vehicle)

[Method 1 — SpaceX IPO mark-to-market]: SATS SpaceX stake at \$1.75T = ~\$38.5B gross. SATS market cap ~\$38–\$40B. Implies stub priced at zero or negative. Post-IPO stub re-rating: ~\$3–\$5B. Implied SATS fair value: \$142–\$156/share vs. ~\$138 current. **60% weight**

[Method 2 — S&P 500 fast-track passive demand]: \$30–\$55B passive buying supports SpaceX at or above IPO level. Removes risk of post-IPO SpaceX price collapse compressing SATS mark. **40% weight (risk-reduction)**

BLENDED TARGET RETURN: +8–15% SATS vs. current • HORIZON 4–6 weeks • +5–10% excess vs. S&P

GOOGL overlay: \$87–\$100B mark-to-market = 1.8–2.1% pure uplift + 1–2% sell-side model-update cycle + orbital data center upside (unscheduled): +3–5%. **GOOGL TARGET: +3–7% | HORIZON 6–12 months**

SCENARIOS — 25% BEAR / 50% BASE / 25% BULL

	Conditions	SATS 3M / 6M / 12M	GOOGL 3M / 6M / 12M
BEAR 25%	SpaceX IPO <\$1.25T; passive inclusion denied; SATS mark below market cap	-25% / -30% / -20%	-3% / -5% / -5%
BASE 50%	SpaceX IPO at \$1.75T; S&P fast-track approved; passive demand \$30–\$55B	+10% / +15% / +20%	+3% / +5% / +8%
BULL 25%	SpaceX prices at \$2T+; same-day S&P inclusion; orbital data center announced	+25% / +35% / +40%	+7% / +10% / +15%
BLENDED		+6% / +9% / +14%	+3% / +4% / +7%

SENSITIVITY

Variable	Shock	SATS Impact	GOOGL Impact
SpaceX IPO valuation	\$1.75T → \$1.25T (-\$500B)	-20–25%	-2%
S&P; fast-track denied	Passive demand absent	-5–8%	Negligible
IPO delay 1 quarter	Sept 2026 push	-15% / full exit	Minimal
GOOGL tax on \$99B gain	21% federal rate	n/a	-33% of net uplift
Orbital data center deal	Strategic re-rating	n/a	+3–5%

SpaceX prices at \$2T	Bull case	+15–20%	+3%
-----------------------	-----------	---------	-----

TRADES

- **CORE SATS** entry ~\$138 • exit ↑ \$155–165 (post-IPO SOTP) • exit ↓ \$115 (kill: delay past Aug 2026 OR SpaceX <\$1.25T)
- **OVERLAY GOOGL** add to existing ~\$395 • target +5–7% over 6–12 months • no explicit stop
- **EVENT SATS into June 12** trim 50% at open on IPO day regardless of direction — event risk symmetry
- **HEDGE Long SATS / short XLC** 1:0.5 beta-adjusted ratio • cover short if IPO confirmed oversubscribed at \$1.75T+
- **AVOID XOVR pre-IPO** SPV structural impairment confirmed • DXYZ: tactical only, stop below \$43

SIZING

SATS: \$400K–\$600K notional • 3–4% book • pre-catalyst — scale to 5–6% on S-1 release ← ENTER HERE

GOOGL: 2–3% book overweight; extend to 4% on orbital data center announcement

DXYZ: 1% book maximum — tactical only — stop \$43

MAX 8% NAV combined SpaceX proxy exposure • EXP RETURN (prob-weighted) SATS +6% / GOOGL +3% • MAX DRAWDOWN TOLERANCE 15% on SATS before reassessment

TIME-SENSITIVE FLAGS & LOW-CONFIDENCE CAVEATS

SPACEX IPO VALUATION RANGE: User stated \$1.75T — confirmed multi-source (CNBC, Bloomberg, Reuters, April 2026). Bloomberg cites targets 'above \$2T.' This note uses \$1.75T base / \$2T bull. No conflict.

SATS SHARE COUNT AND NET DEBT: Sum-of-parts uses ~288M diluted shares and ~\$38–\$40B market cap from May 2026 sources. Exact Q1 2026 net debt and SpaceX share count not verified from primary SEC filing. Single source for 52M SpaceX share count (techi.com, 2026) — treat as directional estimate. Verify against SATS 10-Q on SEC EDGAR before executing.

GOOGL STAKE SIZE POST-xAI MERGER: Original stake 6.11% (Alaska filing, multi-source). Post-xAI merger dilution to ~5% per Bloomberg (April 2026). Exact post-merger share count not disclosed. \$87–\$100B reflects 5–5.7% at \$1.75T–\$2T — directional estimate until S-1 discloses full cap table.

GOOGL TAX LIABILITY: Not modeled in public sell-side reports as of May 2026. Cost basis: \$900M (2015). At \$1.75T SpaceX IPO, unrealized gain ~\$86–\$99B. Corporate tax at 21% = ~\$18–\$21B on realization. Alphabet will NOT be forced to sell on IPO day (lock-up applies).

SATS LOCK-UP / TAX TREATMENT: Tax treatment of spectrum-for-stock exchange (taxable vs. tax-deferred) not confirmed. If taxable, SATS faces cash drain reducing stub value. Single source. Verify with SATS 10-K.

DXYZ ATM OFFERING: Destiny Tech100 filed \$1B ATM offering — confirmed (SEC filing, Stocktitan.net, 2026). Ongoing dilution caps sustainable premium and may suppress short-squeeze catalyst.

XOVR SPV IMPAIRMENT: Confirmed by ETF.com (2026): SpaceX gains did not flow fully to XOVR NAV in Feb 2026. Specific SPV contractual terms not publicly disclosed. Do not size pre-IPO.

S&P; 500 FAST-TRACK RULE: Pending S&P committee review; feedback due May 28 2026; not yet implemented. Treated as base-case scenario, not confirmed event.

BEAR CASE — SHORT THESIS

SHORT THESIS — SPACEX IPO PROXY PLAYS • 18 May 2026 • FOR FRENS AND FAMILIE ONLY

1. THE CASE IN ONE LINE

Retail is buying SATS, RKL B, LUNR, and DXYZ as free-options on a SpaceX mark-to-market re-rate; the re-rate already happened, the fundamentals never arrived, and June 12 is a sell-the-news event, not a catalyst.

2. WHAT THE BULLS ARE MISSING

Assumption A: Proxies haven't priced in the IPO yet

Wrong. RKL B is up 131% since March 30, 2026 alone. LUNR is up 123% over the same window. SATS has rallied 543% over the trailing 12 months. DXYZ was trading at a ~45–50% premium to its December 2025 NAV of \$19.97/share as recently as April 2026. The re-rate has already occurred.

Assumption B: SATS's SpaceX stake converts cleanly to NAV at IPO

Disputed. Requires simultaneously: (a) SpaceX lists at or above \$1.75T, (b) no material lock-up haircut — waivers being 'considered' but not confirmed; standard 90–180-day hold potentially applies, (c) FCC closes spectrum transfers on the November 2027 target on schedule, (d) legacy DISH/Sling/Boost/Hughes businesses don't impair equity bridge. All four must hold simultaneously.

Assumption C: \$1.75T is a floor, not a ceiling

Wrong. SpaceX revenue growth decelerated 89% (2023) → 51% (2024) → 18% (2025). Net loss \$5B in 2025 driven by xAI integration. xAI revenues ~\$500M at \$250B ascribed value = 500x trailing revenue. At \$1.75T, the combined entity trades at ~87–94x 2025 trailing revenue. NYU's Aswath Damodaran: investors 'have already decided SpaceX is a great buy and are now working backwards to justify the price.'

3. THE DATA THEY'RE NOT SHOWING YOU

- SpaceX revenue growth decelerated sharply: 89% → 51% → 18% over 2023–2025. \$5B net loss in 2025. Bulls are extrapolating peak-cycle growth rates into a decelerating business.
- xAI poisons the multiple: EU regulatory probes against Grok flagged as material risk in SpaceX's own S-1. Any adverse ruling compresses the \$250B xAI valuation — the most fragile component of the stack.
- Governance is the most management-favorable in modern IPO history: Musk retains 83.8% voting control via Class B shares (10:1 ratio) on 42.5% economic interest. Texas laws make shareholder action nearly impossible. CalPERS and New York pension officials have written to Musk objecting. Index-forced buyers become exit liquidity for insiders.

- RKL B is not cheap because SpaceX is expensive: P/S ~74x trailing sales at ~\$80B market cap. SpaceX CFO Adam Spice warned the IPO ‘could put weak space stocks into obscurity.’ RKL B short interest 5.5% of float; \$1.9B in YTD mark-to-market losses on bears — squeezed but fundamentals unchanged.
- The IPO itself is a liquidity vacuum: BlackRock eyeing up to \$10B in the deal. At \$75–\$80B projected raise — largest capital absorption event in equity market history — rotation out of proxies and into direct SPCX is structurally inevitable on or after June 12.

4. SHORT CATALYSTS

Catalyst 1 — June 12, 2026: SPCX lists and proxy capital rotates

SPCX begins trading. Direct ownership becomes available to every investor currently holding proxies. Rational trade: sell proxy, buy underlying. Polymarket: 67% implied probability of June listing — the event is expected. Expected events that trigger mechanical selling are the definition of sell-the-news.

Catalyst 2 — EU regulatory action against xAI/Grok, Q3 2026

SpaceX S-1 flags ongoing EU regulatory probes against Grok as a material risk. Any adverse ruling directly attacks the \$250B xAI valuation. A 20% markdown on xAI alone reduces blended SpaceX valuation by ~\$50B, compressing SATS NAV and DXYZ net asset value proportionately.

Catalyst 3 — Lock-up expiry / insider selling window, Sept–Dec 2026

Standard 90-day lock-up from June 12 expires mid-September. SpaceX is ‘considering’ waiving lock-ups — meaning insider selling could begin Day 1. SpaceX conducted tender offers at \$185 (Dec 2024), \$212 (Jul 2025), and \$421 (Dec 2025); employees sitting on 4–9x cost basis. Supply overhang from employee monetization is structurally bearish for sustained post-IPO multiples.

5. WHAT WOULD MAKE ME COVER

- Cover if SpaceX reports Q1/H1 2026 revenue re-acceleration above 35% growth, demonstrating xAI integration is expanding revenue. Current trajectory is 18% with \$5B net loss.
- Cover if lock-up terms are confirmed as 180 days with no waiver AND FCC formally approves SATS spectrum transfers ahead of schedule. Removes both the supply overhang and the critical SATS NAV uncertainty simultaneously.
- Cover if SPCX opens below \$1.4T implied market cap on IPO day — the bear case has already played out.

6. PRICE TARGET / DOWNSIDE SCENARIO

Name	Current	Bear Target	Down-side	Key Assumption
SATS	~\$138/share	\$80–\$95	45–55%	SpaceX lists at \$1.4T; 30% lock-up haircut; FCC 6-month delay; legacy impairment
RKL B	~\$26 (~\$80B mkt cap)	\$13–\$15	40–50%	Post-IPO re-rates to 35–40x sales as direct SpaceX comparison depresses premium

DXYZ	~\$47.62 (94% NAV prem.)	Reverts to NAV ~\$24–\$25	30–33%	SpaceX listing removes case for closed-end fund premium over direct SPCX ownership
-------------	--------------------------	---------------------------	--------	--

DIRECTIONAL ESTIMATE: All price targets derived from scenario analysis and comparable valuation; not from audited financials. Treat as directional until SpaceX S-1 confirms cap table and revenue figures.

LOW-CONFIDENCE FLAGS

- xAI revenue figure of ~\$500M (2025) sourced from secondary analyst estimates, not audited financials. S-1 may disclose a materially different number when published ~May 20, 2026.
- SATS's exact SpaceX share count post-xAI merger not confirmed in a post-merger filing reviewed directly. Dilution impact derived from analyst estimates.
- Lock-up waiver reporting characterises SpaceX as 'considering' a waiver — unconfirmed and structurally consequential if the waiver does not materialise.
- RKL B short interest figure of 5.5% of float sourced from May 2026 reporting; may have changed. A short squeeze in RKL B ahead of June 12 is a real risk to this leg of the trade.

FOR FRENS AND FAMILIE ONLY — not for distribution. Forward-looking estimates subject to material revision. 18 May 2026.
